Each week, each group is required to present their project. Show your tutor:

· What (you are delivering);
· When (you will be delivering);
· Why (you have recommended the artefacts you are delivering);
· How much (time you plan to spend on your project and time you have spent on your project. What is the gap and what are you doing about it)

Presentation Properties
Use models rather than words.

Your tutors are looking for the 'big picture' that describes your project. Be prepared to answer with detail at question time.

This week's specials

Machine Learning & Experimental Evaluation

1. Feature and Experimental Design
- Explain selected features, target or clustering variables, data splits (where relevant), and leakage prevention.

2. Machine Learning Workflow (KNIME)
- Train at least one appropriate method: Linear Regression, Logistic Regression, K-Means, or Naive Bayes.
- Explain the choice of method and demonstrate the workflow.

3. Model Evaluation & Interpretation
- For regression: MAE, RMSE, or R^2; for classification: confusion matrix, precision, recall, or F1; for clustering: silhouette score and interpretable clusters.
- Provide results and interpret what they imply for the decision questions.

4. MySQL Result Integration
- Write prediction, segmentation, or analytical outputs to MySQL and demonstrate the resulting tables.

5. Initial Dashboard Draft
- Show preliminary KPI visuals, filters, and at least one model-result visualization using data from MySQL.

6. Research Paper Progress & Week 4 Plan
- Draft Methodology and Experiments / Results sections, including tables and figures.
- Update WBS and identify remaining tasks.

Goal of Week 3:

A functioning and evaluated machine learning workflow, results stored in MySQL, an initial interactive dashboard, and documented experimental findings.
